

REAR RACK KIT

General Description

The Rear Rack Kit is an option kit for use with Cloud Electronics CXA125 / CXA2125 / CXA250 / CXA2250 ½1U amplifiers. This kit enables one amplifier to be mounted at the rear of an equipment rack.

Installation

You should use this Rear Rack Kit to install a CXA amplifier into a equipment rack.

These rear supports allow the ½1U CXA to be supported in a standard size rack. It is important that you install an amplifier securely to minimise the possibility of vibration and unwanted movement.

It is important in any free standing installation that airflow through the amplifier's side panel mounted fans and rear panel ventilation apertures is not compromised by adjacent items. At least 80mm of free space behind the amplifier and 25mm along at least one side should be retained at all times.

If installing one Amplifier, this kit should be combined with a Half U Kit to ensure the Amplifier is correctly installed in the equipment rack.

Including:
2 x M4 x 8 Screws
(head bolt)
